IT Helpdesk, Access and Security Procedures

Version: DEMO-1.0 | Effective: 28 October 2026 | Owner: Demo Support Operations

TEST DATA ONLY. These policies are fictional examples created to test RAG retrieval, citations, routing and escalation. Replace with reviewed company policies before real-world use.

Common troubleshooting

1. For VPN issues: confirm internet connectivity, restart the VPN client, check device time and retry once; if the error persists, open an IT ticket.

2. For Outlook sync issues: check connectivity, restart Outlook, confirm the service status page and contact IT if still unresolved.

3. For device overheating: stop intensive workloads, ensure ventilation and contact IT if shutdowns recur.

Account access

1. Employees can initiate password resets through the official identity portal. Never share passwords or one-time codes in chat.

2. Lost MFA devices require verified identity and an authorized IT reset process. The AI cannot bypass MFA.

3. Privileged access requests require a business justification, manager approval and security review.

Incident priorities

1. Critical: production-wide outage or active security compromise. Escalate immediately and advise use of the emergency incident channel.

2. High: multiple users blocked or suspected phishing credential exposure. Escalate urgently.

3. Normal: single-user software installation or noncritical troubleshooting. Use documented self-service steps first.

Escalation

1. Do not execute commands on customer systems, reset credentials, or grant access without approved integrations and permissions.

2. For suspected credential compromise, direct users to official incident reporting immediately.

RAG evaluation: Answers should cite this document and the relevant section. If the document lacks a fact, state that it is not available and offer escalation.
